

AN ANSWER TO CANCER MAY LIE IN A SINGLE DROPLET OF BLOOD.

That's the promise of proteomics, an exciting new field we're pioneering right now at the University of Pittsburgh Medical Center. By studying patterns of proteins in blood, we're learning to diagnose cancer earlier and determine better treatments for specific cancers. This type of leading-edge research is about more than just simply applying scientific knowledge. Advances in medicine require experience, understanding and application. UPMC has worked relentlessly to build bridges between research and clinical practice. Fueled by dedication and determination, insight and imagination become our most powerful tools.
